

CSC 365: Internet Programming
Homework 2: BankAccount with a private balance

1. Goal: Practice using JavaScript objects and function.

2. Requirements

- (a) Write a function `createBankAccount(owner, initialBalance)` that returns an object.
- (b) Keep the balance in a closure (not on the returned object).
- (c) The returned object should expose only these members:
 - i. `owner` (string)
 - ii. `deposit(amount)` → adds to balance; throw if `amount <= 0`
 - iii. `withdraw(amount)` → subtracts if enough funds; throw if not enough
 - iv. `getBalance()` → returns the current balance (number)
- (d) Show a short demo: Create an account, do one deposit and one withdrawal, print the final balance.

3. Demo

```
const acc = createBankAccount('Ada', 20);
console.log(acc.deposit(15)); // balance: 35
console.log(acc.withdraw(10)); // balance: 25
console.log(acc.owner); // "Ada"
console.log(acc.getBalance()); // 25
```
